Upscaling in socio-environmental systems modelling: Current challenges, promising strategies and insights from ecology

A. Upscaling from patch to landscape scale using transition matrices

Table S1: Comparison of the rangeland model and irrigation technology example.

| Characteristic | Rangeland model (Cipriotti et al. 2016) | Irrigation technology diffusion |
|----------------------------|--|--|
| Type of upscaling | Spatial | Organisational / spatial |
| <i>Scale</i> | | |
| <u>Local</u> | | |
| Resolution | Tuft 30cm x 30cm | Household |
| Extent | 128 x 128 tuft cells = 0.15 ha → 1 patch | Village |
| <u>Regional</u> | | |
| Resolution | Patch 38.4m x 38.4m | Village |
| Extent | 135 x 210 patches = 4180 ha | Region |
| System properties | | |
| <u>Local</u> | | |
| Properties of local entity | <u>Individual tuft:</u> <ul style="list-style-type: none"> - State: live tussock, dead tussock or empty - Live tussock cell: green biomass, dead biomass, potential productivity <u>Patch:</u> <ul style="list-style-type: none"> - Initial vegetation condition | <u>Household:</u> <ul style="list-style-type: none"> - Technology adopted: yes/no - Personal information level (depends on # neighbours + village information level) - <i>Possible extension: different levels of openness to innovation</i> <u>Village:</u> <ul style="list-style-type: none"> - Local information level (knowledge about technology present in each village) - Average number of neighbours in village |

| | | |
|---|---|---|
| External driver | <ul style="list-style-type: none"> - Precipitation - Stocking rate (constant) | <ul style="list-style-type: none"> - Precipitation - <i>Possible extension: technology subsidies</i> |
| Structure and processes included | <ul style="list-style-type: none"> - Water dynamics - Vegetation growth, colonisation & mortality - Grazing | <ul style="list-style-type: none"> - Technology adoption decision: related to number of neighbours and village information level and precipitation level |
| <u>Regional</u> | | |
| Properties of the regional entity | <ul style="list-style-type: none"> - Initial vegetation state - Stocking rate (defined via <i>grazing attractiveness</i>) | <ul style="list-style-type: none"> - Initial state of technology adoption - <u>Social condition</u>: <ul style="list-style-type: none"> - Information level (defined via knowledge in neighbouring villages) - Average number of neighbours in village |
| External driver | <ul style="list-style-type: none"> - Precipitation | <ul style="list-style-type: none"> - Precipitation |
| Additional structures and processes included | <ul style="list-style-type: none"> - Grazing attractiveness: determines stocking rate based on vegetation state of all cells | <ul style="list-style-type: none"> - Adjustment of information level based on villages in neighbourhood |
| Output | | |
| Target variables (local and regional) | <ul style="list-style-type: none"> - Vegetation cover - Primary production - Cover of large bare gaps | <ul style="list-style-type: none"> - Share of HHs that adopted technology |
| Simplifying assumptions | | |
| Local scale | <ul style="list-style-type: none"> - Only interaction between cells through water competition - Spatially homogeneous with regard to precipitation and topography | <ul style="list-style-type: none"> - No spatial heterogeneity with regard to precipitation |
| Local to regional scale | <ul style="list-style-type: none"> - No cross-scale interactions between small and large scale | <ul style="list-style-type: none"> - No cross-scale interactions between small and large scale |
| Regional scale | <ul style="list-style-type: none"> - No seed dispersal | <ul style="list-style-type: none"> - No long-distance interactions between villages (i.e. only next neighbours) - No other external influences (e.g. policies, etc.) |

Irrigation technology

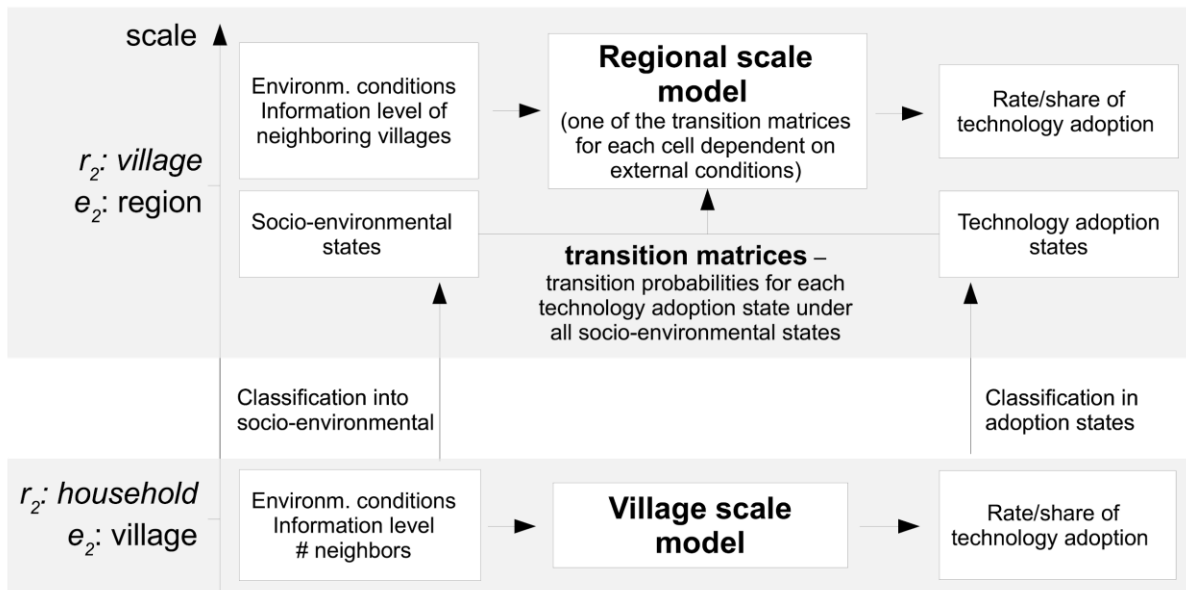

Figure S1: Application of the upscaling scheme to the hypothetical irrigation technology example.
